**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

# Office Action Summary

**Application No.**

10/810,623

**Applicant(s)**

BLAIR ET AL.

**Examiner**

NABIL H. SYED

**Art Unit**

2612

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 26 March 2008.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 40-61 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 40-61 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-946)
- 3) ☐ Information Disclosure Statement(s) (PTO/SG/US)  
Paper No(s)/Mail Date \_\_\_\_\_
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date \_\_\_\_\_
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: \_\_\_\_\_

## DETAILED ACTION

### Claim Rejections - 35 USC § 112

1. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

2. Claims 40, 45 and 61 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

As of claims 40, 45 and 61, the limitations "tag element to generate at least one *un-modulated* return signal in response to energization by said varying wideband interrogation signal" and "at least wherein one return signal is un-modulated" are not defined in the specification. It is unclear to the examiner that how a tag is generating an un-modulated signal. From the specification it is seen that "the tag, when excited, transmits an image signal of its resonance decay, via magnetic coupling, back to the detection wand which contains a receiver circuit (see specification, paragraph [0037]). Examiner is interpreting the image signal of tags resonance decay as "un-modulated" signal.

**Claim Rejections - 35 USC § 103**

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 40, 44-46, 50-53, 58, 60 and 61, are rejected under 35 U.S.C. 103(a) as being unpatentable over Blair (6,026,818) in view of Rubin (6,359,562).

As of claims 40, 44, 45, 52, 53 and 61, Blair discloses an apparatus adapted to detect an object in a work area, the object having a tag element affixed thereto (see abstract), the apparatus comprising:

a first electronic circuit coupled to a transmit/receive antenna and adapted to emit a wideband interrogation signal (Blair discloses that a detector device (see fig. 10) is used to excite the tag with signals over a wide bandwidth, hence comprising a first electronic circuit; see col. 5, lines 65-67; also see fig. 3), the wideband interrogation signal having a plurality of pulses adapted to additively build energy in said tag element to enable tag element to generate at least one return signal that is an image of a resonance decay of additively built energy of said tag element (Blair discloses that the pulsed transmissions allow the system to pump more energy into the tag through several pulses, and the tag when excited transmits an image signal of its resonance decay, via magnetic coupling back to the detection wand which contains a receiver circuit (see col. 6, lines 3-10), Blair

also discloses that the tuned transmitter of the interrogator builds additive energy into the tag (see col. 6, lines 53-55); and

a second electronic circuit coupled to transmit/receive antenna and adapted to determine whether tag element is present in said work area and to discriminate at least one return signal from noise, based on a magnitude of resonance decay that commences after turn-off of at least one of pulses (Blair discloses that the receiver is also wideband whereby it can see tags over a wide spectrum benefiting from fast transmitter signal decay; see col. 6, lines 56-58. Blair further discloses that the system uses a half duplex system, so transmitter transmits a signal and after the transmission of the pulse is finished the detection wand is switched to the receiving mode; see col. 7, lines 12-24; also see col. 5, lines 1-20).

However Blair fails to disclose that interrogation transmits a varying interrogation signal.

Rubin discloses a electronic article security system wherein when interrogation (via transmission system 10) transmits an interrogation signal the frequency of the alternating electric signal varies in accordance with a numerical frequency control signal; see col. 2, lines 66 through col. 3, line1).

From the teaching of Rubin it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the system of Blair to include an interrogator which transmits a varying interrogation signal as taught by Rubin in order to generate a wide variety of accurately controlled frequency patterns and with potential improvement in the probability of detection of the tags.

As of claims 46 and 52, Blair discloses that at least one return signal includes a relatively narrowband return signal centered about a specific, but not predetermined frequency (see col. 11, lines 3-10).

As of claims 50 and 58, Blair discloses that second electronic circuit includes a digital signal processor (DSP) adapted to filter at least one return signal from noise (via DSP 62; see fig. 6 and 3; also see col. 6, lines 64-67).

As of claims 51 and 60, Blair discloses that first and second electronic circuits and said transmit/receive antenna are part of a hand-held scanning device adapted to detect said object having said tag element affixed thereto in said work area, including a surgical area internal to a patient (see col. 5, lines 43-54).

5. Claims 41, 47 and 55 are rejected under 35 U.S.C. 103(a) as being unpatentable over Blair (6,026,818) in view of Rubin (6,359,562) and further in view of Pauly et al. (6,349,234).

As of claims 41, 47 and 55, Blair discloses all the limitation of the claimed invention as mentioned in claims 44 and 52 above but fails to explicitly disclose that interrogator transmits a pulse-width interrogation signal.

Pauly discloses a tag (via pacer 106) and an interrogator (via programmer 110) (see fig. 1). Pauly discloses that various communications technique such as pulse-width modulation (PWM), frequency shift keying (FSK) or other suitable techniques can be used (see fig. 2 and fig. 3; also see col. 6, lines 31-45)

From the teaching of Pauly it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the interrogator of Blair to

include the function of producing pulse width modulation signal as taught by Pauly since pulse width modulation is a common technique to convey information over a communications channel.

6. Claims 42, 48 and 56 are rejected under 35 U.S.C. 103(a) as being unpatentable over Blair (6,026,818) in view of Rubin (6,359,562) and further in view of Lewiner et al. (4,893,118).

As of claims 42, 48 and 56, Blair discloses all the limitation of the claimed invention as mentioned in claims 44 and 52 above but fails to explicitly disclose that interrogator transmits a voltage varying interrogation signal.

Lewiner discloses an interrogator, which produces a voltage-modulated signal (see claim 1).

From the teaching of Lewiner it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the interrogator of Blair to include the function of producing a voltage modulated signal as taught by Lewiner since it is well known in the art that the interrogators are used to transmit an energy signal to power the passive tags.

7. Claims 43, 49 and 57 are rejected under 35 U.S.C. 103(a) as being unpatentable over Blair (6,026,818) in view of Rubin (6,359,562) and further in view of Chung (6,696,954).

As of claims 43, 49 and 57, the combination of Blair and Rubin discloses all the limitation of the claimed invention but fails to explicitly disclose that transmit/receive antenna includes three mutually orthogonal rings, each adapted to individually transmit

and interrogation signal in round-robin succession in respective coordinate directions and each adapted to receive at least one return signal, wherein transmit and receive cycles of each ring are clocked as to avoid overlap with transmit and receive cycles of others rings.

Chung discloses a detection arrangement for detecting a wireless article associated with an object within a detection region comprising: a first loop antenna having a loop conductor in the X-Y plane, a second loop antenna having a loop conductor in substantially in a plane rotated about the X direction to be at an angle with respect to the X-Y plane, a third loop antenna having a loop conductor substantially in a plane rotated about the Y direction to be at an angle with respect to the X-Y plane, and each antenna is adapted to transmit and receive signals and having a processor which process transmitted and received electrical signals hence clocking the received and transmitted signal to avoid overlap (see fig. 2, antenna 30; also see col. 4, lines 19-35; and col. 17, lines 58 through col. 18, lines 40).

From the teaching of Chung it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the combination of Blair and Rubin to include a multi directional antenna as taught by Chung in order to enhance the detection process of the tags because multiple carrier signals can be transmitted using a multiple directional antenna.

8. Claim 59 is rejected under 35 U.S.C. 103(a) as being unpatentable over Blair (6,026,818) in view of Rubin (6,359,562) and further in view Hossack et al. (5,928,151).

As of claim 59, the combination of Blair and Rubin discloses all the limitation of the claimed invention as mentioned in claim 52 above but fails to explicitly disclose that the second electronic circuit (inside the interrogator) includes a Bessel filter.

Hossack discloses an interrogator (via transmit beamformer 40; see fig. 1) which includes a Bessel filter 58 (see fig. 2).

From the teaching of Hossack it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the combination of Blair and Rubin to include a Bessel filter in the interrogator as taught by Hossack in order to preserve the wave shape of filtered signals in the passband.

### **Response to Arguments**

9. Applicant's arguments with respect to all the claims have been considered but are moot in view of the new ground(s) of rejection.

Note: In the arguments, applicant argues that Rubin does not teach various limitations in newly added claims 40- 61. Examiner would like to point out that the limitation which are argued by the applicant are rejected using Blair and the reference of Rubin is brought in to teach the limitation that it is known to transmits a *varying interrogation signal* (see the rejection above).

### **Conclusion**

10. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to NABIL H. SYED whose telephone number is (571)270-3028. The examiner can normally be reached on M-F 7:30-5:00 alt Friday off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Brian Zimmerman can be reached on (571)272-3059. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
